

# Polishing Pads

Polishing pads are used as carrier of polishing slurries and are considered as alternative materials for polishing pitches. In dependence on glasses or crystals that should be polished as well as on the surface characteristics that should be achieved one distinguishes a few polishing pad materials based on polyurethane, felt, and suede. The polyurethane polishing pads are **hard** and help to achieve very good surface flatness (below  $\lambda/300$  per inch), but usually at the expense of surface smoothness (increasing of surface roughness up to 0.5-1nm). The felt polishing pads are less hard (**intermediate**) and are recommended as compromise materials to achieve standard optical flatness ( $\lambda/10$  per inch) along with standard optical roughness (0.1-0.5nm). The suede polishing pads are **soft** and serve first of all to achieve the maximal possible surface smoothness (roughness below 0.1nm), but at the expense of surface flatness. The suede polishing pads should be used only for finishing for a few minutes to improve the surface smoothness and not to lose much surface flatness. Certainly the surrounding conditions as well as the quality of polishing slurries influence the final result of the polishing.
